Novel heterocycles substituted by a phenyl group having herbicidal and growth-inhibiting properties have now been found.

The present invention accordingly relates to compounds of formula I

Examples of suitable heterocycles and heteroaromatic compounds include: pyrrolidine, piperidine, pyran, dioxane, azetidine, oxetane, pyridine, pyrimidine, triazine, thiazole, thiadiazole, imidazole, oxazole, isoxazole and also pyrazine, furan, morpholine, piperazine, pyrazole, benzoxazole, benzthiazole, quinoxaline and quinoline. Those heterocycles and heteroaromatic compounds may be further substituted, for example by halogen, alkyl, alkoxy, haloalkyl, haloalkoxy, nitro, cyano, thioalkyl, alkylamino or by phenyl.

Within the scope of the present invention, 3- to 7-membered cyclic groups are to be understood as meaning ring systems that, in addition to the hetero atoms that may already be present in the ring of the substituent Q, may contain, besides the carbon atoms, one or more hetero atoms, such as nitrogen, oxygen and/or sulfur. They may be saturated or unsaturated. The unsaturated bond may, for example in the group Q₂, be formed by the substituents R₆ and R₇. Preferably, such ring systems contain from 5 to 7 ring atoms. 3- to 7-membered cyclic groups, including the cycloalkyls, for example cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl or cyclooctyl, may also be substituted. Suitable substituents include halogen, hydroxy, nitro, cyano, C₁-C₄alkylcarbonyl, C₁-C₄-alkoxycarbonyl, C₁-C₄alkyl, C₁-C₄haloalkyl, keto, C₂-C₄alkenyloxyimino, C₁-C₄alkoxy, C₁-C₄alkoxyalkoxy, C₁-C₄alkylthio, or one of the following three groups:

The compounds of formula I can be prepared by reacting a compound of formula XXX

wherein Q is Q_1 , Q_2 , Q_3 , Q_4 , Q_5 , Q_6 , Q_7 , Q_8 , Q_9 or Q_{10} , the substituents of which, with the exception of G_1 , G_2 , G_3 , G_4 , G_5 , G_6 , G_7 , G_8 , G_9 and G_{10} , have the meanings given above, and G_1 , G_2 , G_3 , G_4 , G_5 , G_6 , G_7 , G_8 , G_9 and G_{10} are hydrogen, with a compound of formula XXXI

wherein R_1 and R_3 are as defined for formula I and Hal is chlorine, bromine or iodine, in the presence of an inert solvent, a base and a palladium catalyst, at temperatures of from 30 to 250°C. The reaction is preferably carried out under an inert gas atmosphere.

Surprisingly, it has been shown that this process is very especially advantageous for the preparation of compounds of formula I wherein R_1 and R_3 are ethyl. The intermediates of

formula XXXI wherein R_1 and R_3 are ethyl and Hal is chlorine, bromine or iodine (formula XXXIa) used for the preparation of those compounds of formula I are novel and were developed especially for that process. The present invention accordingly also relates to those intermediates.

The compounds of formula XXX are known or can be prepared according to known processes, as described, for example, in J. Chem. Soc. Perkin Trans. 1 (1987), (4), 877-884. The compounds of formula XXXI can be prepared, for example, according to known methods, *via* the diazonium salts, for example by Sandmeyer reaction starting from the corresponding anilines of formula XXXII

wherein R_1 and R_3 are as defined for formula I. Such reactions are described, for example, in Vogel's Textbook of Practical Organic Chemistry, 5th Edition, B.S. Furniss, A.J. Hannaford, P.W.G. Smith, A.R. Tatchell; Longman Scientific & Technical 1989, page 923. The compounds of formula XXXII are known; some of them are available commercially or they can be prepared analogously to known methods.

There are suitable for the reaction bases such as trialkali metal phosphates, alkali metal and alkaline earth metal hydrides, alkali metal and alkaline earth metal amides or alkali metal alcoholates, for example tripotassium phosphate, sodium hydride, lithium diisopropylamide (LDA), sodium tert-butanolate or potassium tert-butanolate. Sodium tert-butanolate, potassium tert-butanolate and tripotassium phosphate are especially preferred.

Suitable solvents include, for example, aromatic hydrocarbons, for example xylene or toluene, ethers, such as tetrahydrofuran, dioxane or ethylene glycol dimethyl ether, dimethyl sulfoxide or tertiary amides, such as dimethylformamide, N-methylpyrrolidinone or dimethyl acetamide, and acyclic ureas, such as N,N'-dimethylpropyleneurea.

Palladium catalysts that come into consideration for the C-C coupling reaction of a compound of formula XXX with a compound of formula XXXI are generally palladium(II) or

palladium(0) complexes, for example palladium(II) dihalides, palladium(II) acetate, palladium(II) sulfate, bis(triphenylphosphine)palladium(II) dichloride, bis(tricyclopentylphosphine)palladium(II) dichloride, bis(tricyclohexylphosphine)palladium(II) dichloride, bis(dibenzylideneacetone)palladium(0) or tetrakis(triphenylphosphine)palladium(0). The palladium catalyst can also be prepared "*in situ*" from palladium(II) or palladium(0) compounds by complexing with the desired ligands, by, for example, combining the palladium(II) salt to be complexed, for example palladium(II) dichloride (PdCl_2) or palladium(II) acetate ($\text{Pd}(\text{OAc})_2$), together with the desired ligand, for example triphenylphosphine (PPh_3), tricyclopentylphosphine or tricyclohexylphosphine and the selected solvent, with a compound of formula XXXI, a compound of formula XXX and a base. Also suitable are bidentate ligands, for example 1,1'-bis(diphenylphosphino)ferrocene or 1,2-bis(diphenylphosphino)ethane. By heating the reaction medium, the palladium(II) complex or palladium(0) complex desired for the C-C coupling reaction is thus formed "*in situ*", and then initiates the C-C coupling reaction.

The palladium catalysts are used in an amount of from 0.001 to 50 mol %, preferably in an amount of from 0.1 to 15 mol %, based on the compound of formula XXXI.

The reaction temperatures are selected in accordance with the solvent used and, where applicable, in accordance with the pressure. Preferably, the reaction is carried out at atmospheric pressure.

The compounds of formula I wherein Q is Q_1 can be prepared analogously to the procedures described in WO 96/21652. Compounds of formula I wherein Q is Q_2 can be prepared, for example, in accordance with the procedures described in EP-A-0 415 185, EP-A-0 521 334, EP-A-0 355 599 and EP-A-0 442 077. Compounds of formula I wherein Q is Q_3 , Q_4 , Q_6 or Q_7 can be prepared, for example, in accordance with the procedures described in WO 96/35644 and WO 97/02243. Compounds of formula I wherein Q is Q_5 can be prepared, for example, analogously to the procedures described in WO 97/14667. Analogous procedures for the preparation of compounds of formula I wherein Q is Q_7 are described in WO 97/16436. Compounds of formula I in which Q is Q_8 can be prepared analogously to US-A-5 994 274. Compounds of formula I wherein Q is Q_9 can be prepared analogously to JP 11152273 A (priority: 19.11.1997 JP 318614), Compounds of formula I wherein Q is Q_{10} can be prepared according to J. Org. Chem. (1979), 44(26), 4906-4912 or J. Org. Chem. (1977), 42(7), 1163-1169 or in an analogous manner.

The reactions to form compounds of formula I are advantageously carried out in aprotic, inert organic solvents. Such solvents are hydrocarbons, such as benzene, toluene, xylene or cyclohexane, chlorinated hydrocarbons, such as dichloromethane, trichloromethane, tetrachloromethane or chlorobenzene, ethers, such as diethyl ether, ethylene glycol dimethyl ether, diethylene glycol dimethyl ether, tetrahydrofuran or dioxane, nitriles, such as acetonitrile or propionitrile, and amides, such as N,N-dimethylformamide, diethylformamide or N-methylpyrrolidinone. The reaction temperatures are preferably from -20°C to +120°C. The reactions are generally slightly exothermic and can usually be carried out at room temperature. To shorten the reaction time or also to initiate the reaction, the temperature can, if desired, be increased to the boiling point of the reaction mixture for a brief period. The reaction times can also be shortened by the addition of a few drops of base as reaction catalyst. Suitable bases include especially tertiary amines, such as trimethylamine, triethylamine, quinuclidine, 1,4-diazabicyclo[2.2.2]octane, 1,5-diazabicyclo[4.3.0]non-5-ene and 1,5-diazabicyclo[5.4.0]undec-7-ene, but it is also possible to use inorganic bases, such as hydrides, for example sodium or calcium hydride, hydroxides, for example sodium or potassium hydroxide, carbonates, for example sodium or potassium carbonate, or hydrogen carbonates, for example potassium or sodium hydrogen carbonate.

The compounds of formula I can be isolated in customary manner by concentration and/or evaporation of the solvent and can be purified by recrystallisation or trituration of the solid residue in solvents in which they are not readily soluble, such as ethers, aromatic hydrocarbons or chlorinated hydrocarbons.

For the use in accordance with the invention of the compounds of formula I or of compositions comprising them, there are suitable any of the methods of application customary in agriculture, such as pre-emergence application, post-emergence application and seed dressing, and also various methods and techniques, for example the controlled release of active ingredient. In that method, the active ingredient is applied in solution to mineral granule carriers or polymerised granules (urea/formaldehyde) and dried. Where appropriate, it is also possible to apply a coating (coated granules) that allows the active ingredient to be released in metered amounts over a specific period.

The compounds of formula I can be used as herbicides in unmodified form, that is to say as obtained in the synthesis. Preferably, however, they are formulated in customary manner

using the adjuvants customarily employed in formulation technology, for example into emulsifiable concentrates, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granules or microcapsules. Such formulations are described, for example, in WO 97/34485 on pages 9 to 13. As with the nature of the compositions, the methods of application, such as spraying, atomising, dusting, wetting, scattering or pouring, are chosen in accordance with the intended objectives and the prevailing circumstances.

The formulations, i.e. the compositions, preparations or mixtures comprising the active ingredient of formula I or at least one active ingredient of formula I and generally one or more solid or liquid formulation adjuvants, are prepared in known manner, e.g. by intimately mixing and/or grinding the active ingredients with the formulation adjuvants, e.g. solvents or solid carriers. In addition, it is also possible for surface-active compounds (surfactants) to be used in the preparation of the formulations. Examples of solvents and solid carriers are given, for example, in WO 97/34485 on page 6.

Depending on the nature of the active ingredient of formula I to be formulated, suitable surface-active compounds are non-ionic, cationic and/or anionic surfactants and mixtures of surfactants having good emulsifying, dispersing and wetting properties. Examples of suitable anionic, non-ionic and cationic surfactants are listed, for example, on pages 7 and 8 of WO 97/34485. Also suitable for the preparation of the herbicidal compositions according to the invention are the surfactants customarily employed in formulation technology, which are described, *inter alia*, in "Mc Cutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1981, Stache, H., "Tensid-Taschenbuch", Carl Hanser Verlag, Munich/Vienna, 1981 and M. and J. Ash, "Encyclopedia of Surfactants", Vol I-III, Chemical Publishing Co., New York, 1980-81.

The activity of the herbicidal and plant growth-inhibiting compositions according to the invention comprising a herbicidally effective amount of compound of formula I can be increased by the addition of spray tank adjuvants.

Such adjuvants may be, for example: non-ionic surfactants, mixtures of non-ionic surfactants, mixtures of anionic surfactants with non-ionic surfactants, cationic surfactants, organosilicon surfactants, mineral oil derivatives with and without surfactants, vegetable oil derivatives with and without the addition of surfactant, alkylated derivatives of oils of vegetable or mineral

origin with and without surfactants, fish oils and other animal oils of animal nature and alkyl derivatives thereof with and without surfactants, naturally occurring higher fatty acids, preferably having from 8 to 28 carbon atoms, and alkyl ester derivatives thereof, organic acids containing an aromatic ring system and one or more carboxylic acid esters, and alkyl derivatives thereof, and also suspensions of polymers of vinyl acetate or of copolymers of vinyl acetate/acrylic acid esters. Mixtures of individual adjuvants with one another and combined with organic solvents may lead to the activity being further increased.

Suitable non-ionic surfactants include, for example, polyglycol ether derivatives of aliphatic or cycloaliphatic alcohols, of saturated or unsaturated fatty acids and alkylphenols, preferably that can contain from 3 to 30 glycol ether groups and from 8 to 20 carbon atoms in the (aliphatic) hydrocarbon radical and from 6 to 18 carbon atoms in the alkyl radical of the alkylphenols.

Further suitable non-ionic surfactants are the water-soluble polyethylene oxide adducts of polypropylene glycol, ethylenediaminopolypropylene glycol and alkyl polypropylene glycol having preferably from 1 to 10 carbon atoms in the alkyl chain, which adducts contain preferably from 20 to 250 ethylene glycol ether groups and from 10 to 100 propylene glycol ether groups. The said compounds usually contain from 1 to 5 ethylene glycol units per propylene glycol unit.

There may also be mentioned, as further examples of non-ionic surfactants, nonylphenol polyethoxyethanols, castor oil polyglycol ethers, polypropylene/polyethylene oxide adducts, tributylphenoxypolyethoxyethanol, polyethylene glycol and octylphenoxypolyethoxyethanol.

Fatty acid esters of polyoxyethylenesorbitan, e.g. polyoxyethylenesorbitan trioleate, are also suitable.

Preferred anionic surfactants are especially alkyl sulfates, alkyl sulfonates, alkylaryl sulfonates, alkylated phosphoric acids, and ethoxylated derivatives thereof. The alkyl radicals usually contain from 8 to 24 carbon atoms.

Preferred non-ionic surfactants are known by the following trade names:

polyoxyethylene cocoalkylamine (e.g. AMIET[®] 105 (Kao Co.)), polyoxyethylene oleylamine (e.g. AMIET[®] 415 (Kao Co.)), nonylphenol polyethoxyethanols, polyoxyethylene stearylamine (e.g. AMIET[®] 320 (Kao Co.)), N-polyethoxyethylamines (e.g. GENAMIN[®] (Hoechst AG)), N,N,N',N'-tetra(polyethoxypolypropoxyethyl)ethylene-diamine (e.g. TERRONIL[®] and TETRONIC[®] (BASF Wyandotte Corp.)), BRIJ[®] (Atlas Chemicals), ETHYLAN[®] CD and ETHYLAN[®] D (Diamond Shamrock), GENAPOL[®] C, GENAPOL[®] O, GENAPOL[®] S and GENAPOL[®] X080 (Hoechst AG), EMULGEN[®] 104P, EMULGEN[®] 109P and EMULGEN[®] 408 (Kao Co.); DISTY[®] 125 (Geronazzo), SOPROPHOR[®] CY 18 (Rhone Poulenc S.A.); NONISOL[®] (Ciba-Geigy), MRYJ[®] (ICI); TWEEN[®] (ICI); EMULSOGEN[®] (Hoechst AG); AMIDOX[®] (Stephan Chemical Co.), ETHOMID[®] (Armak Co.); PLURONIC[®] (BASF Wyandotte Corp.), SOPROPHOR[®] 461P (Rhône Poulenc S.A.), SOPROPHOR[®] 496/P (Rhone Poulenc S.A.), ANTAROX FM-63 (Rhone Poulenc S.A.), SLYGARD 309 (Dow Corning), SILWET 408, SILWET L-7607N (Osi-Specialities).

The cationic surfactants are especially quaternary ammonium salts that contain as N-substituent(s) at least one alkyl radical having from 8 to 22 carbon atoms and, as further substituents, optionally halogenated lower alkyl, benzyl or hydroxy-lower alkyl radicals. The salts are preferably in the form of halides, methyl sulfates or ethyl sulfates, for example stearyltrimethylammonium chloride or benzyldi(2-chloroethyl)ethylammonium bromide.

The oils used are either of mineral or natural origin. The natural oils can in addition be of animal or vegetable origin. Of the animal oils preference is given especially to derivatives of beef tallow, but fish oils (e.g. sardine oil) and derivatives thereof are also used. Vegetable oils are mostly seed oils of varied origin. Examples of vegetable oils used especially that may be mentioned include coconut oil, rapeseed oil and sunflower oil and derivatives thereof.

In the composition according to the invention, the concentrations of oil additive are generally from 0.01 to 2 %, based on the spray mixture. The oil additive can, for example, be added to the spray tank in the desired concentration after the spray mixture has been prepared.

Preferred oil additives in the composition according to the invention comprise an oil of vegetable origin, for example rapeseed oil or sunflower oil, alkyl esters of oils of vegetable origin, for example methyl derivatives, or mineral oils.

Especially preferred oil additives comprise alkyl esters of higher fatty acids (C_8 - C_{22}), especially the methyl derivatives of C_{12} - C_{18} fatty acids, for example the methyl esters of lauric acid, palmitic acid and oleic acid. Those esters are known as methyl laurate (CAS-111-82-0), methyl palmitate (CAS-112-39-0) and methyl oleate (CAS-112-62-9).

The application and action of the oil additives can be improved by combining them with surface-active substances, such as non-ionic, anionic or cationic surfactants. Examples of suitable anionic, non-ionic and cationic surfactants are listed in WO 97/34485 on pages 7 and 8.

Preferred surface-active substances are anionic surfactants of the dodecylbenzylsulfonate type, especially the calcium salts thereof, and also non-ionic surfactants of the fatty alcohol ethoxylate type. Special preference is given to ethoxylated C_{12} - C_{22} fatty alcohols having a degree of ethoxylation of from 5 to 40. Examples of commercially available preferred surfactants are the Genapol types (Clariant AG, Muttenz, Switzerland).

The concentration of the surface-active substances in relation to the total additive is generally from 1 to 30 % by weight.

Examples of oil additives consisting of mixtures of oils or mineral oils or derivatives thereof with surfactants include Edenor ME SU®, Emery 2231® (Henkel subsidiary Cognis GMBH, DE), Turbocharge® (Zeneca Agro, Stoney Creek, Ontario, CA) or, more especially, Actipron® (BP Oil UK Limited, GB).

The addition of an organic solvent to the oil additive/surfactant mixture can, furthermore, bring about a further increase in activity. Suitable solvents include, for example, Solvesso® (ESSO) and Aromatic Solvent® (Exxon Corporation) types.

The concentration of such solvents can be from 10 to 80 %, by weight, of the total weight.

Such oil additives, which, for example, are also described in US-A-4 834 908, are especially preferred for the composition according to the invention. A more especially preferred oil additive is known by the name MERGE®, can be obtained from BASF Corporation and is basically described, for example, in US-A-4 834 908, col. 5, as Example COC-1. A further oil

additive that is preferred in accordance with the invention is SCORE® (Novartis Crop Protection Canada).

Surfactants, oils, especially vegetable oils, derivatives thereof, such as alkylated fatty acids and mixtures thereof, for example with preferably anionic surfactants, such as alkylated phosphoric acids, alkyl sulfates and alkylaryl sulfonates and also higher fatty acids, that are customary in formulation and adjuvant technology and that can also be used in the compositions according to the invention and in spray tank solutions thereof, are described, *inter alia*, in "Mc Cutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1998, Stache, H., "Tensid-Taschenbuch", Carl Hanser Verlag, Munich/Vienna, 1990, M. and J. Ash, "Encyclopedia of Surfactants", Vol I-IV, Chemical Publishing Co., New York, 1981-89, G. Kapusta, "A Compendium of Herbicide Adjuvants", Southern Illinois Univ. , 1998, L. Thomson Harvey, "A Guide to Agricultural Spray Adjuvants Used in the United States", Thomson Pubns., 1992.

The herbicidal formulations generally contain from 0.1 to 99 % by weight, especially from 0.1 to 95 % by weight, of herbicide, from 1 to 99.9 % by weight, especially from 5 to 99.8 % by weight, of a solid or liquid formulation adjuvant, and from 0 to 25 % by weight, especially from 0.1 to 25 % by weight, of a surfactant. Whereas commercial products will preferably be formulated as concentrates, the end user will normally employ dilute formulations. The compositions may also comprise further ingredients, such as stabilisers, for example vegetable oils or epoxidised vegetable oils (epoxidised coconut oil, rapeseed oil or soybean oil), anti-foams, for example silicone oil, preservatives, viscosity regulators, binders, tackifiers and also fertilisers or other active ingredients.

The active ingredients of formula I are generally used on the plants or the locus thereof at rates of application of from 0.001 to 4 kg/ha, especially from 0.005 to 2 kg/ha. The concentration required to achieve the desired effect can be determined by experiment. It is dependent on the type of action, the development stage of the crop plant and of the weed and on the application (place, time, method) and, in dependence on those parameters, can vary within wide ranges.

The compounds of formula I are distinguished by herbicidal and growth-inhibiting properties that make them suitable for use in crops of useful plants, especially in cereals, cotton,

soybeans, sugar beet, sugar cane, plantation crops, rape, maize and rice, and for non-selective weed control. Crops are also to be understood as including those that have been rendered tolerant to herbicides or classes of herbicides by conventional breeding or genetic engineering methods. Those include, for example, IMI Maize, Poast Protected Maize (sethoxydim tolerance), Liberty Link Maize, B.t./Liberty Link Maize, IMI/Liberty Link Maize, IMI/Liberty Link /B.t. Maize, Roundup Ready Maize and Roundup Ready/B.t. Maize.

The weeds to be controlled may be either monocotyledonous or dicotyledonous weeds, for example Stellaria, Nasturtium, Agrostis, Digitaria, Avena, Setaria, Sinapis, Lolium, Solanum, Echinochloa, Scirpus, Monochoria, Sagittaria, Bromus, Alopecurus, Sorghum halepense, Rottboellia, Cyperus, Abutilon, Sida, Xanthium, Amaranthus, Chenopodium, Ipomoea, Chrysanthemum, Galium, Viola and Veronica.

Surprisingly, it has been shown that special safeners, known from US-A-5 041 157, US-A-5 541 148, US-A-5 006 656, EP-A-0 094 349, EP-A-0 551 650, EP-A-0 268 554, EP-A-0 375 061, EP-A-0 174 562, EP-A-492 366, WO 91/7874, WO 94/987, DE-A-19612943, WO 96/29870, WO 98/13361, WO 98/39297, WO 98/27049, EP-A-0 716 073, EP-A-0 613 618, US-A-5 597 776, EP-A-0 430 004, DE-A-4 331 448, WO 99/16744, WO 00/30447 and WO 00/00020, are suitable for mixing with the herbicidal compositions according to the invention. The present invention accordingly relates also to a selective-herbicidal composition for controlling grasses and weeds in crops of useful plants, especially in crops of maize and cereals, which composition comprises a herbicide of formula I and a safener (antidote) and protects the useful plants, but not the weeds, against the phytotoxic action of the herbicide, and to the use of such a composition in the control of weeds in crops of useful plants.

There is thus proposed, in accordance with the invention, a selective-herbicidal composition that comprises as active ingredient, in addition to customary inert formulation adjuvants, such as carriers, solvents and wetting agents, a mixture of

Suitable cultivated plants that can be protected against the harmful effect of the above-mentioned herbicides by the safeners of formula X, XI, XII, XIII, XIV, XV, XVI, XVII or XVIII are especially cereals, cotton, soybeans, sugar beet, sugar cane, plantation crops, rape, maize and rice, more especially maize and cereals. Crops are also to be understood as including those that have been rendered tolerant to herbicides or classes of herbicides by conventional breeding or genetic engineering methods.

The weeds to be controlled may be either monocotyledonous or dicotyledonous weeds, for example the monocotyledonous weeds *Avena*, *Agrostis*, *Phalaris*, *Lolium*, *Bromus*, *Alopecurus*, *Setaria*, *Digitaria*, *Brachiaria*, *Echinochloa*, *Panicum*, *Sorghum hal./bic.*, *Rottboellia*, *Cyperus*, *Brachiaria*, *Echinochloa*, *Scirpus*, *Monochoria*, *Sagittaria* and *Stellaria* and the dicotyledonous weeds *Sinapis*, *Chenopodium*, *Galium*, *Viola*, *Veronica*, *Matricaria*, *Papaver*, *Solanum*, *Abutilon*, *Sida*, *Xanthium*, *Amaranthus*, *Ipomoea* and *Chrysanthemum*.

Areas of cultivation are areas of land on which the cultivated plants are already growing or in which the seeds of those cultivated plants have already been sown, as well as the areas of land on which it is intended to grow those cultivated plants.

A safener of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX may, depending on the intended purpose, be used to pretreat the seed material of the cultivated plant (dressing the seed or the cuttings) or may be incorporated into the soil before or after sowing. It can, however, also be applied alone or together with the herbicide after the emergence of the plants. The treatment of the plants or seed with the safener can therefore, in principle, be effected independently of the time at which the herbicide is applied. The treatment of the plants can, however, also be carried out by applying the herbicide and safener simultaneously (for example in the form of a tank mixture). The rate of application of the safener in relation to the herbicide depends largely on the method of application. In the case of field treatment, which is effected either using a tank mixture comprising a combination of safener and herbicide or by the separate application of safener and herbicide, the ratio of herbicide to safener is generally from 100:1 to 1:10,

preferably from 20:1 to 1:1. In the case of field treatment, from 0.001 to 1.0 kg of safener/ha, preferably from 0.001 to 0.25 kg of safener/ha, is generally applied.

The rate of application of herbicide is generally from 0.001 to 2 kg/ha, but is preferably from 0.005 to 0.5 kg/ha.

The compositions according to the invention are suitable for any of the methods of application customary in agriculture, for example pre-emergence application, post-emergence application and seed dressing.

In the case of seed dressing, from 0.001 to 10 g of safener/kg of seed, preferably from 0.05 to 2 g of safener/kg of seed, is generally applied. When the safener is applied in liquid form shortly before sowing, with swelling of the seed, it is advantageous to use safener solutions that comprise the active ingredient in a concentration of from 1 to 10 000 ppm, preferably from 100 to 1000 ppm.

For application, the safeners of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX, or combinations of those safeners with the herbicides of formula I, are advantageously processed, together with the adjuvants customary in formulation technology, into formulations, for example into emulsifiable concentrates, coatable pastes, directly sprayable or dilutable solutions, dilute emulsions, wettable powders, soluble powders, dusts, granules or microcapsules.

Such formulations are described, for example, in WO 97/34485, on pages 9 to 13. The formulations are prepared in known manner, e.g. by intimately mixing and/or grinding the active ingredients with liquid or solid formulation adjuvants, for example solvents or solid carriers. Furthermore, in addition surface-active compounds (surfactants) can be used in the preparation of the formulations. Solvents and solid carriers suitable for that purpose are mentioned, for example, in WO 97/34485, on page 6.

Depending on the nature of the active ingredient of formula I to be formulated, there come into consideration as surface-active compounds non-ionic, cationic and/or anionic surfactants and mixtures of surfactants having good emulsifying, dispersing and wetting properties. Examples of suitable anionic, non-ionic and cationic surfactants are listed, for example, in

WO 97/34485 on pages 7 and 8. Also suitable for the preparation of the herbicidal compositions according to the invention are the surfactants customarily employed in formulation technology, which are described, *inter alia*, in "Mc Cutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1981, Stache, H., "Tensid-Taschenbuch", Carl Hanser Verlag, Munich/Vienna, 1981 and M. and J. Ash, "Encyclopedia of Surfactants", Vol I-III, Chemical Publishing Co., New York, 1980-81.

The herbicidal formulations generally contain from 0.1 to 99 % by weight, especially from 0.1 to 95 % by weight, of active ingredient mixture comprising the compound of formula I and the compounds of formulae X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX, from 1 to 99.9 % by weight of a solid or liquid formulation adjuvant and from 0 to 25 % by weight, especially from 0.1 to 25 % by weight, of a surfactant. Whereas commercial products will usually preferably be formulated as concentrates, the end user will normally employ dilute formulations.

The compositions may also comprise further additives, such as stabilisers, vegetable oils or epoxidised vegetable oils (epoxidised coconut oil, rapeseed oil or soybean oil), anti-foams, e.g. silicone oil, preservatives, viscosity regulators, binders, tackifiers and also fertilisers or other active ingredients. There are various suitable methods and techniques for using safeners of formulae X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX or compositions comprising them to protect cultivated plants against the harmful effects of herbicides of formula I; the following are examples:

i) Seed dressing

- a) Dressing the seeds with a wettable powder formulation of an active ingredient of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX, by shaking in a vessel until the formulation is uniformly distributed on the seed surface (dry dressing). Approximately from 1 to 500 g of active ingredient of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX (from 4 g to 2 kg of wettable powder) are used per 100 kg of seed.
- b) Dressing the seeds with an emulsifiable concentrate of an active ingredient of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX in accordance with method a) (wet dressing).

c) Dressing by immersing the seeds in a liquid formulation containing from 100 to 1000 ppm of active ingredient of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX for from 1 to 72 hours and, if desired, subsequently drying the seeds (immersion dressing).

Dressing the seeds or treating the germinated seedlings are naturally the preferred methods of application, because treatment with the active ingredient is directed wholly at the target crop. From 1 to 1000 g of antidote, preferably from 5 to 250 g of antidote, is generally used per 100 kg of seed, although depending on the method employed, which also allows the addition of other active ingredients or micronutrients, amounts that exceed or fall short of the specified concentration limits may be employed (repeat dressing).

ii) Application in the form of a tank mixture

A liquid formulation of a mixture of antidote and herbicide (ratio of the one to the other from 10:1 to 1:100) is used, the rate of application of herbicide being from 0.005 to 5.0 kg per hectare. Such tank mixtures are applied before or after sowing.

iii) Application to the seed furrow

The active ingredient of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX is introduced into the open, sown seed furrow in the form of an emulsifiable concentrate, wettable powder or granules. After the seed furrow has been covered, the herbicide is applied pre-emergence in the normal manner.

iv) Controlled active ingredient release

The active ingredient of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX is applied in solution to mineral granule carriers or polymerised granules (urea/formaldehyde) and dried. Where appropriate, it is also possible to apply a coating (coated granules) that allows the active ingredient to be released in metered amounts over a specific period.

The activity of herbicidal and plant growth-inhibiting compositions according to the invention comprising a herbicidally effective amount of compound of formula I and a herbicide-antagonistically effective amount of compound of formula X, XI, XII, XIII, XIV, XV, XVI, XVII,

XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX can be increased by the addition of spray tank adjuvants.

Such adjuvants may be, for example: non-ionic surfactants, mixtures of non-ionic surfactants, mixtures of anionic surfactants with non-ionic surfactants, cationic surfactants, organosilicon surfactants, mineral oil derivatives with and without surfactants, vegetable oil derivatives with and without the addition of surfactant, alkylated derivatives of oils of vegetable or mineral origin with and without surfactants, fish oils and other animal oils of animal nature and alkyl derivatives thereof with and without surfactants, naturally occurring higher fatty acids, preferably having from 8 to 28 carbon atoms, and alkyl ester derivatives thereof, organic acids containing an aromatic ring system and one or more carboxylic acid esters, and alkyl derivatives thereof, and also suspensions of polymers of vinyl acetate or copolymers of vinyl acetate/acrylic acid esters. Mixtures of individual adjuvants with one another and combined with organic solvents may lead to the activity being further increased.

Suitable non-ionic surfactants include, for example, polyglycol ether derivatives of aliphatic or cycloaliphatic alcohols, of saturated or unsaturated fatty acids and alkylphenols, preferably that can contain from 3 to 30 glycol ether groups and from 8 to 20 carbon atoms in the (aliphatic) hydrocarbon radical and from 6 to 18 carbon atoms in the alkyl radical of the alkylphenols.

Further suitable non-ionic surfactants are the water-soluble polyethylene oxide adducts of polypropylene glycol, ethylenediaminopolypropylene glycol and alkyl polypropylene glycol having preferably from 1 to 10 carbon atoms in the alkyl chain, which adducts contain preferably from 20 to 250 ethylene glycol ether groups and from 10 to 100 propylene glycol ether groups. The said compounds usually contain from 1 to 5 ethylene glycol units per propylene glycol unit.

There may also be mentioned, as further examples of non-ionic surfactants, nonylphenol polyethoxyethanols, castor oil polyglycol ethers, polypropylene/polyethylene oxide adducts, tributylphenoxy polyethoxy ethanol, polyethylene glycol and octylphenoxy polyethoxyethanol.

Fatty acid esters of polyoxyethylenesorbitan, e.g. polyoxyethylenesorbitan trioleate, are also suitable.

Preferred anionic surfactants are especially alkyl sulfates, alkyl sulfonates, alkylaryl sulfonates, alkylated phosphoric acids, and ethoxylated derivatives thereof. The alkyl radicals usually contain from 8 to 24 carbon atoms.

Preferred non-ionic surfactants are known by the following trade names:

polyoxyethylene cocoalkylamine (e.g. AMIET® 105 (Kao Co.)), polyoxyethylene oleylamine (e.g. AMIET® 415 (Kao Co.)), nonylphenol polyethoxyethanols, polyoxyethylene stearylamine (e.g. AMIET® 320 (Kao Co.)), N-polyethoxyethylamines (e.g. GENAMIN® (Hoechst AG)), N,N,N',N'-tetra(polyethoxypolypropoxyethyl)ethylene-diamine (e.g. TERRONIL® and TETRONIC® (BASF Wyandotte Corp.)), BRIJ® (Atlas Chemicals), ETHYLAN® CD and ETHYLAN® D (Diamond Shamrock), GENAPOL® C, GENAPOL® O, GENAPOL® S and GENAPOL® X080 (Hoechst AG), EMULGEN® 104P, EMULGEN® 109P and EMULGEN® 408 (Kao Co.); DISTY® 125 (Geronazzo), SOPROPHOR® CY 18 (Rhone Poulenc S.A.); NONISOL® (Ciba-Geigy), MRYJ® (ICI); TWEEN® (ICI); EMULSOGEN® (Hoechst AG); AMIDOX® (Stephan Chemical Co.), ETHOMID® (Armak Co.); PLURONIC® (BASF Wyandotte Corp.), SOPROPHOR® 461P (Rhône Poulenc S.A.), SOPROPHOR® 496/P (Rhone Poulenc S.A.), ANTAROX FM-63 (Rhone Poulenc S.A.), SLYGARD 309 (Dow Corning), SILWET 408, SILWET L-7607N (Osi-Specialities).

The cationic surfactants are especially quaternary ammonium salts that contain as N-substituent(s) at least one alkyl radical having from 8 to 22 carbon atoms and, as further substituents, optionally halogenated lower alkyl, benzyl or hydroxy-lower alkyl radicals. The salts are preferably in the form of halides, methyl sulfates or ethyl sulfates, for example stearyltrimethylammonium chloride or benzyldi(2-chloroethyl)ethylammonium bromide.

The oils used are either of mineral or natural origin. The natural oils can in addition be of animal or vegetable origin. Of the animal oils preference is given especially to derivatives of beef tallow, but fish oils (e.g. sardine oil) and derivatives thereof are also used. Vegetable oils are mostly seed oils of varied origin. Examples of vegetable oils used especially that may be mentioned include coconut oil, rapeseed oil and sunflower oil and derivatives thereof.

In the composition according to the invention, the concentrations of oil additive are generally from 0.01 to 2 % based on the spray mixture. The oil additive can, for example, be added to the spray tank in the desired concentration after the spray mixture has been prepared.

Preferred oil additives in the composition according to the invention comprise an oil of vegetable origin, for example rapeseed oil or sunflower oil, alkyl esters of oils of vegetable origin, for example methyl derivatives, or mineral oils.

Especially preferred oil additives comprise alkyl esters of higher fatty acids (C_8 - C_{22}), especially methyl derivatives of C_{12} - C_{18} fatty acids, for example the methyl esters of lauric acid, palmitic acid and oleic acid. Those esters are known as methyl laurate (CAS-111-82-0), methyl palmitate (CAS-112-39-0) and methyl oleate (CAS-112-62-9).

The application and action of the oil additives can be improved by combining them with surface-active substances, such as non-ionic, anionic or cationic surfactants. Examples of suitable anionic, non-ionic and cationic surfactants are listed in WO 97/34485 on pages 7 and 8.

Preferred surface-active substances are anionic surfactants of the dodecylbenzylsulfonate type, especially the calcium salts thereof, and also non-ionic surfactants of the fatty alcohol ethoxylate type. Special preference is given to ethoxylated C_{12} - C_{22} fatty alcohols having a degree of ethoxylation of from 5 to 40. Examples of commercially available preferred surfactants are the Genapol types (Clariant AG, Muttenz, Switzerland).

The concentration of the surface-active substances in relation to the total additive is generally from 1 to 30 % by weight.

Examples of oil additives that consist of mixtures of oils or mineral oils, or derivatives thereof, with surfactants include Edenor ME SU®, Emery 2231® (Henkel subsidiary Cognis GMBH, DE), Turbocharge® (Zeneca Agro, Stoney Creek, Ontario, CA) or, more especially, Actipron® (BP Oil UK Limited, GB).

The addition of an organic solvent to the oil additive/surfactant mixture can also bring about further increase in activity. Suitable solvents include, for example, Solvesso® (ESSO) and Aromatic Solvent® (Exxon Corporation) types.

The concentration of such solvents can be from 10 to 80 %, by weight, of the total weight.

Such oil additives, which, for example, are also described in US-A-4 834 908, are especially preferred for the composition according to the invention. A more especially preferred oil additive is known by the name MERGE®, can be obtained from BASF Corporation and is basically described, for example, in US-A-4 834 908, col. 5, as Example COC-1. A further oil additive that is preferred in accordance with the invention is SCORE® (Novartis Crop Protection Canada).

Surfactants, oils, especially vegetable oils, derivatives thereof, such as alkylated fatty acids and mixtures thereof, for example with preferably anionic surfactants, such as alkylated phosphoric acids, alkyl sulfates and alkylaryl sulfonates and also higher fatty acids, that are customary in formulation and adjuvant technology and that can also be used in the compositions according to the invention and in spray tank solutions thereof, are described, *inter alia*, in "McCutcheon's Detergents and Emulsifiers Annual" MC Publishing Corp., Ridgewood New Jersey, 1998, Stache, H., "Tensid-Taschenbuch", Carl Hanser Verlag, Munich/Vienna, 1990, M. and J. Ash, "Encyclopedia of Surfactants", Vol I-IV, Chemical Publishing Co., New York, 1981-89, G. Kapusta, "A Compendium of Herbicide Adjuvants", Southern Illinois Univ. , 1998, L. Thomson Harvey, "A Guide to Agricultural Spray Adjuvants Used in the United States", Thomson Pubns., 1992.

It is often more practical to formulate the active ingredient of formula I and the mixing partner of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX separately and then, shortly before application, to bring them together in the applicator in the desired mixing ratio in the form of a "tank mixture" in water.

The ability of the safeners of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX to protect cultivated plants against the phytotoxic action of herbicides of formula I is illustrated in the following Examples.

Biological Example 1: Safening action

Under greenhouse conditions, the test plants are grown in plastics pots to the 4-leaf stage. At that stage, on the one hand the herbicide alone, and on the other hand mixtures of the herbicide with the test substances to be tested as safeners, are applied to the test plants. The test substances are applied in the form of an aqueous suspension prepared from a 25 % wettable powder (Example F3, b)), using 500 litres of water/ha. 2 to 3 weeks after application, the phytotoxic action of the herbicide on the cultivated plants, for example maize and cereals, is evaluated using a percentage scale. 100 % indicates that the test plant has died, and 0 % indicates no phytotoxic action.

The results obtained in this test demonstrate that the damage caused to the cultivated plant by the herbicide of formula I can be appreciably reduced by the compounds of formula X, XI, XII, XIII, XIV, XV, XVI, XVII, XVIII, XIX, XX, XXI, XXII, XXIII, XXIV, XXV, XXVI, XXVII, XXVIII or XXIX. Examples of those results are given in the following Table B5:

Table B5: Post-emergence action of a mixture according to the invention of herbicide and safener:

Test plant	Comp. No. 1.01 (60 g/ha)	Comp. No. 1.01 (60 g/ha) + Comp. No. 11.03 (15 g/ha)
Barley	20	0
Agrostis	70	70
Alopecurus	70	80
Lolium	70	70

It can be seen from Table 5 that compound No. 1.01 exhibits a phytotoxic effect of 20 % on barley, which is not tolerable. The weeds Agrostis, Alopecurus und Lolium are satisfactorily controlled.

In contrast, the mixture according to the invention, consisting of herbicide No. 1.01 and safener No. 11.03, has no phytotoxic effect on the cultivated plant. At the same time, the herbicidal effect on the weeds is not only identical but surprisingly, in the case of Alopecurus, even increased (80 % compared with the 70 % achieved with the application of herbicide No. 1.01 on its own).

The same results are obtained when the mixtures are formulated in accordance with Examples F1, F2 and F4 to F8.

The compound of formula I can advantageously be mixed with a number of other known herbicides. The following Examples illustrate the invention further without implying any limitation.

Preparation Examples:

Example P1: Preparation of

To a solution of 20 g of 2-(2,6-dibromo-4-methyl-phenyl)-malonic acid dimethyl ester (52.6 mmol) in 400 ml of toluene (degassed 3 times, vacuum/argon) there are added first 36.7 g (0.116 mol) of tributylvinylstannane and then 2 g of tetrakis(triphenylphosphine)-palladium. The reaction mixture is then stirred for 9 hours at a temperature of from 90 to 95°C. After filtration over Hyflo and concentration using a rotary evaporator, and after purification by chromatography, 15.3 g of (8) are obtained in the form of a yellow oil, which is used in the next reaction without being further purified.

Example P2:

15.2 g of compound (8) obtained according to Example P1 are hydrogenated with hydrogen over a palladium catalyst (carbon as carrier, 7 g of 5% Pd/C) in 160 ml of tetrahydrofuran at a temperature of from 20 to 25°C. When the hydrogenation is complete, the product is filtered over Hyflo and the filtrate obtained is concentrated using a rotary evaporator. 13.7 g of (9) are obtained in the form of yellow crystals having a melting point of from 47 to 49 °C.

Example P3:

71.8 g (0.71 mol) of triethylamine are added to a suspension of 40 g (0.15 mol) of (4) in 1000 ml of xylene and the mixture is degassed (4 times, vacuum/argon). The yellow suspension is then heated to a temperature of 60°C and stirred for 3 hours. 42.5 g (0.15 mol) of (5) are subsequently added and the mixture is heated to a bath temperature of 150°C in order continuously to distill off excess triethylamine and the resulting ethanol. After 3 hours, the reaction mixture is cooled to a temperature of 40°C and introduced into 500 ml of an ice/water mixture. The reaction mixture is rendered alkaline using 100 ml of aqueous 1N sodium hydroxide solution, and the aqueous phase (containing the product) is washed twice with ethyl acetate. After then washing the organic phase twice with aqueous 1N sodium hydroxide solution, the aqueous phases are combined, the remaining xylene is distilled off and the combined aqueous phases are adjusted to pH 2-3 using 4N HCl with cooling. The precipitated product obtained is poured onto a suction filter, and the filtration residue is washed with water and briefly with hexane, and then dried *in vacuo* at a temperature of 60°C

over P_2O_5 . 34.6 g of (6) are obtained in the form of a slightly beige solid having a melting point of from 242 to 244°C (decomposition).

Example P4:

A catalytic amount of 4-dimethylaminopyridine is added to a solution, cooled to a temperature of 0°C, of 3 g (10.4 mmol) of (6) and 1.6 g (15.8 mmol) of triethylamine in 100 ml of tetrahydrofuran. 1.57 g (13.0 mmol) of pivaloyl chloride is then added dropwise. After stirring for 30 minutes at a temperature of 0°C, the cooling is removed and the stirring is continued for a further 60 minutes. The reaction mixture is then introduced into saturated aqueous sodium chloride solution and the organic phase is separated off. The organic phase is dried over magnesium sulfate, filtered off and concentrated by evaporation. After purification by chromatography and recrystallisation from diethyl ether, 2.94 g of (7) having a melting point of from 135 to 136°C are obtained.

Example P5: Preparation of 2-(2,6-diethyl-4-methyl-phenyl)-tetrahydro-pyrazolo[1,2-a]pyridazine-1,3-dione:

1.39 g of tetrahydro-pyrazolo[1,2-a]pyridazine-1,3-dione and 2.68 g of sodium tertiary butanolate are dissolved at 20° in 20 ml of dimethylformamide, and 3.21 g of 2,6-diethyl-4-methyl-iodobenzene and 0.82 g of $Pd(TPP)_2Cl_2$ are added. Stirring is then carried out for 2.5 hours at 125°. After cooling to room temperature, 200 ml of ethyl acetate and 200 ml of ether are added and the reaction mixture is poured onto a suction filter. 100 ml of water and 100 ml of methylene chloride are added to the filtration residue, and acidification is carried out using hydrochloric acid. The organic phase is separated off, dried and concentrated by evaporation.

The residue (1.9 g) is chromatographed on silica gel (ethyl acetate/hexane 3:1).

2-(2,6-Diethyl-4-methyl-phenyl)-tetrahydro-pyrazolo[1,2-a]pyridazine-1,3-dione is obtained in the form of beige crystals having a melting point of from 174 to 175°.

Example P6: Preparation of 2-(2,6-diethyl-4-methyl-phenyl)-tetrahydro-pyrazolo[1,2-a]pyridazine-1,3-dione:

1.39 g of tetrahydro-pyrazolo[1,2-a]pyridazine-1,3-dione and 2.68 g of sodium tertiary butanolate are dissolved at 20° in 20 ml of dimethylformamide, and 2.66 g of 2,6-diethyl-4-methyl-bromobenzene as well as 0.82 g of Pd(TPP)₂Cl₂ are added. Stirring is then carried out for 2.5 hours at 125°. After cooling to room temperature, 200 ml of ethyl acetate and 200 ml of ether are added, and the reaction mixture is poured onto a suction filter. 100 ml of water and 100 ml of methylene chloride are added to the filtration residue and acidification is carried out using hydrochloric acid. The organic phase is separated off, dried and concentrated by evaporation. The residue (1.4 g) is chromatographed on silica gel (ethyl acetate/hexane 3:1).

2-(2,6-Diethyl-4-methyl-phenyl)-tetrahydro-pyrazolo[1,2-a]pyridazine-1,3-dione is obtained in the form of beige crystals having a melting point of from 174 to 175°.

In the following Tables, the melting points are quoted in °C. Me denotes the methyl group. Where a formula is given for the substituents G₁ to G₁₀ and R₄ and R₅ (independently of each other), the left-hand side of that formula is the linking point to the oxygen atom of the heterocycle Q₁ to Q₁₀. In the case of the substituent meaning of R₄ and R₅ together, the right-hand side of the molecule is the linking point to the heterocycle Q₁. The remaining terminal valencies are methyl groups.

In the following Tables, "LC/MS: M+" expresses in daltons the positively charged molecular ion that has been ascertained from the mass spectrum in the analysis of the product by coupled HPLC (High Performance Liquid Chromatography) and MS (Mass Spectrometry) devices.

Biological ExamplesComparison test:

The following compounds were tested for their herbicidal action:

compound no. 1.02

according to the present invention, and compound A

Example B1: Herbicidal action prior to emergence of the plants (pre-emergence action)

Monocotyledonous and dicotyledonous weeds are sown in plastics pots in standard soil. Immediately after sowing, the test substances are applied in the form of an aqueous suspension (prepared from a 25 % wettable powder (Example F3, b)) or in the form of an emulsion (prepared from a 25 % emulsifiable concentrate (Example F1, c)) (500 litres of water/ha). The rate of application is 500 g of active substance/ha. The test plants are then grown in the greenhouse under optimum conditions. The evaluation is carried out 3 weeks after application, using a scale of nine ratings (1 = total damage, 9 = no action). Ratings of from 1 to 4 (especially from 1 to 3) indicate good to very good herbicidal action.

Test plants: Alopecurus (Alo), Avena (Ave), Lolium (Lol), Setaria (Set), Panicum (Pan), Sorghum (Sor), Digitaria (Dig), Echinochloa (Ech) and Brachiaria (Bra).

Table B1: Pre-emergence action:

Pre-emergence action at 500 g of active ingredient/ha

Comp. No.	Alo	Ave	Lol	Set	Pan	Sor	Dig	Ech	Bra
compound A	2	4	1	2	1	4	4	5	3
1.02	1	1	1	1	1	1	4	1	1

Example B2: Herbicidal action after emergence of the plants (post-emergence action):

Monocotyledonous and dicotyledonous weeds are grown in standard soil in plastics pots under greenhouse conditions. The test substances are applied to the test plants at the 3- to 6-leaf stage. The test substances are applied at a rate of application of 500 g of active substance per hectare in the form of an aqueous suspension (prepared from a 25 % wettable powder (Example F3, b)) or in the form of an emulsion (prepared from a 25 % emulsifiable concentrate (Example F1, c)) (500 litres of water/ha). The evaluation is carried out 3 weeks after application, using a scale of nine ratings (1 = total damage, 9 = no action). Ratings of from 1 to 4 (especially from 1 to 3) indicate good to very good herbicidal action.

Test plants: Alopecurus (Alo), Avena (Ave), Lolium (Lol), Setaria (Set), Panicum (Pan), Sorghum (Sor), Digitaria (Dig), Echinocloa (Ech) and Brachiaria (Bra).

Table B2: Post-emergence action:

Post-emergence action at 250 g of active ingredient/ha

Comp. No.	Alo	Ave	Lol	Set	Pan	Sor	Dig	Ech	Bra
compound A	3	3	2	2	1	3	2	1	2
1.02	1	1	1	1	1	1	2	1	1

By comparing the herbicidal activity of compound A with compound no. 1.02 of the present invention, it can be seen that, in the case of all weeds tested, compound no. 1.02 surprisingly exhibits an appreciably improved herbicidal action, although the only difference between that compound and compound A is that two ethyl groups have been replaced by methyl groups.

Example B3: Herbicidal action prior to the emergence of the plants (pre-emergence action) of compounds of the present invention:

Monocotyledonous and dicotyledonous weeds are sown in standard soil in plastics pots. Immediately after sowing, the test substances are applied in the form of an aqueous suspension (prepared from a 25 % wettable powder (Example F3, b)) or in the form of an emulsion (prepared from a 25 % emulsifiable concentrate (Example F1, c)) (500 litres of water/ha). The rate of application is 500 g of active substance/ha. The test plants are then grown in the greenhouse under optimum conditions. The evaluation is carried out 3 weeks after application, using a scale of nine ratings (1 = total damage, 9 = no action). Ratings of from 1 to 4 (especially from 1 to 3) indicate good to very good herbicidal action.

Test plants: Avena (Ave), Lolium (Lol), Setaria (Set).
